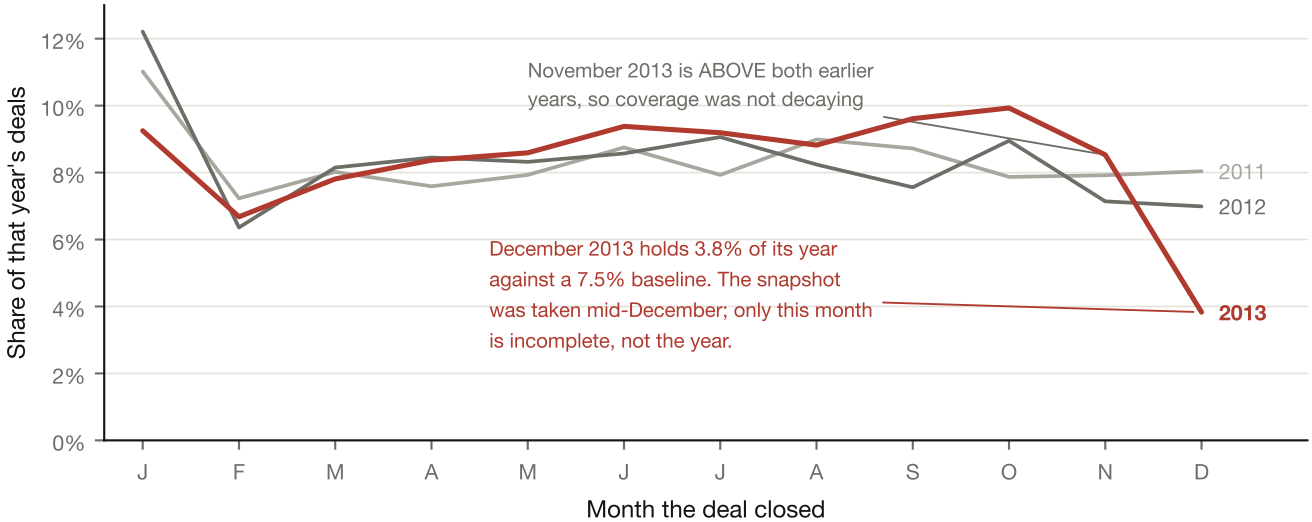
Only December 2013 is censored, which is why the window closes at 2012

Monthly deals as a share of their own year, 2011–2013.



Source: Crunchbase 2013 Snapshot (CC BY 4.0); author's calculations. Deal counts before the analysis window is applied. Expressing each month as a share of its own year removes the level difference between years so the shapes are comparable. The disclosed-amount rate is flat across these years (88.99 / 88.61 / 88.44%), and November and December 2013 are among the highest monthly rates in the series, so dollars are not differentially censored either. The window still closes at 2012-12-31, on the coverage-growth argument rather than this one.
