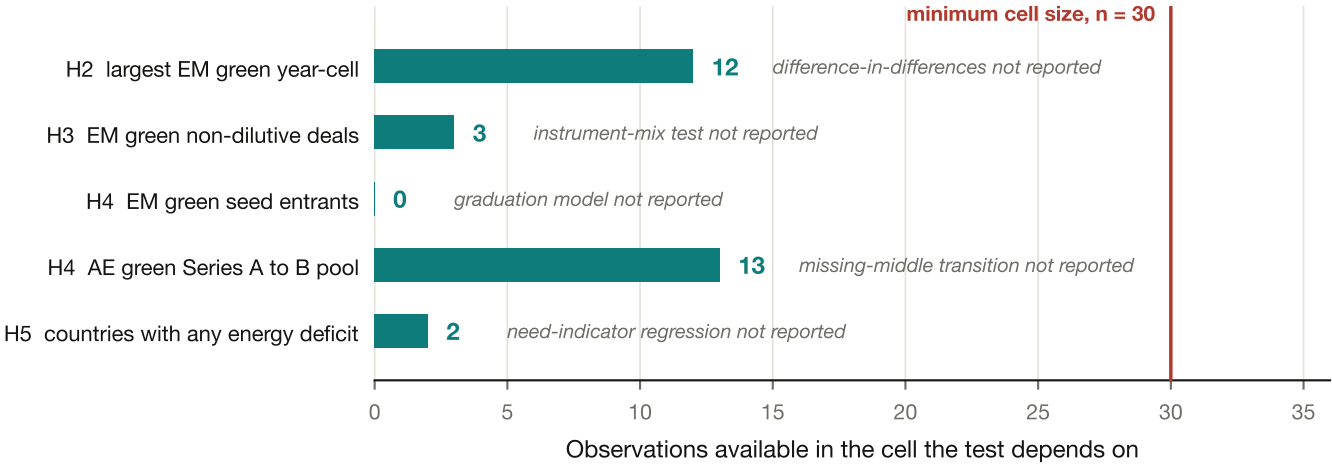
Every emerging-market test fails on the same wall, for different reasons

Observations available against the pre-registered minimum cell size, across H2–H5.



Source: Crunchbase 2013 Snapshot (CC BY 4.0); author's calculations. The minimum cell size of 30 was fixed in config before any hypothesis was tested, and no bar clears it. These are five distinct failures rather than one repeated: a difference-in-differences with no usable time series; an instrument-mix comparison resting on 3 non-dilutive deals, drawn from an emerging-market green sample of 34 which does itself clear the threshold; a graduation model with no entrants at all; a missing-middle transition holding 13 companies even in the best-covered bloc; and a need regressor on which 20 of 22 countries record exactly zero. Three
