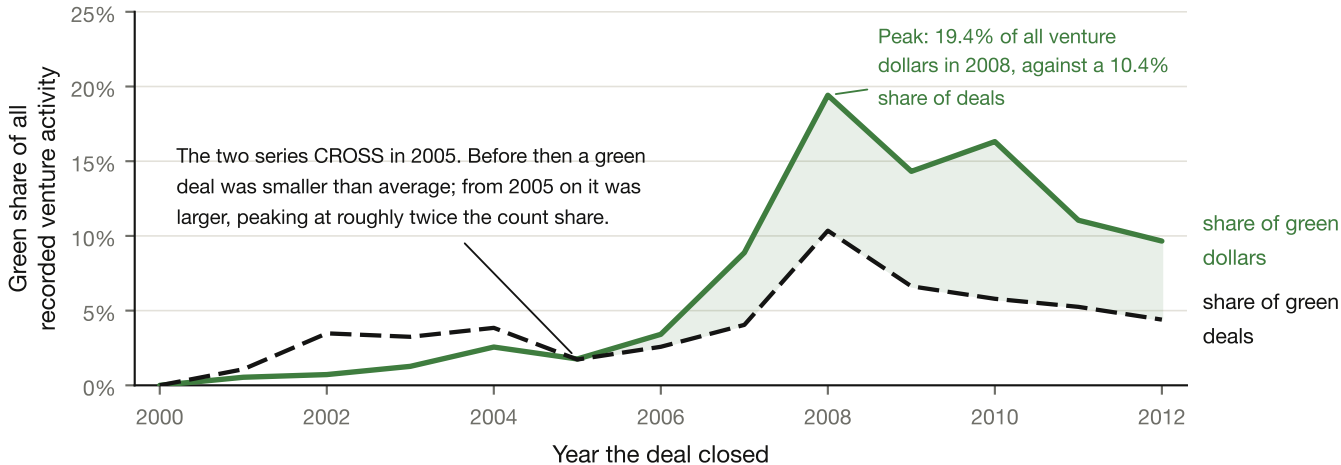
From 2005, green took a bigger share of venture dollars than of deals

Green as a share of all recorded deals and of all disclosed dollars, 2000–2012. Constant 2015 USD.



Source: Crunchbase 2013 Snapshot (CC BY 4.0); author's calculations. n = 41,105 deals, 2,174 green. The dollar series covers the disclosed subsample only, and both series are computed on that same subsample's denominator where dollars are concerned, so the comparison is internally consistent. A dollar share above the count share means the average green cheque exceeded the average cheque overall, which is consistent with green being capital-intensive; it does not test the cross-sector elasticity of Figure 1b. The ordering reverses before 2005, when green deals were SMALLER than average, on thin cells: 2001 n=1, 2002 n=4, 2003
