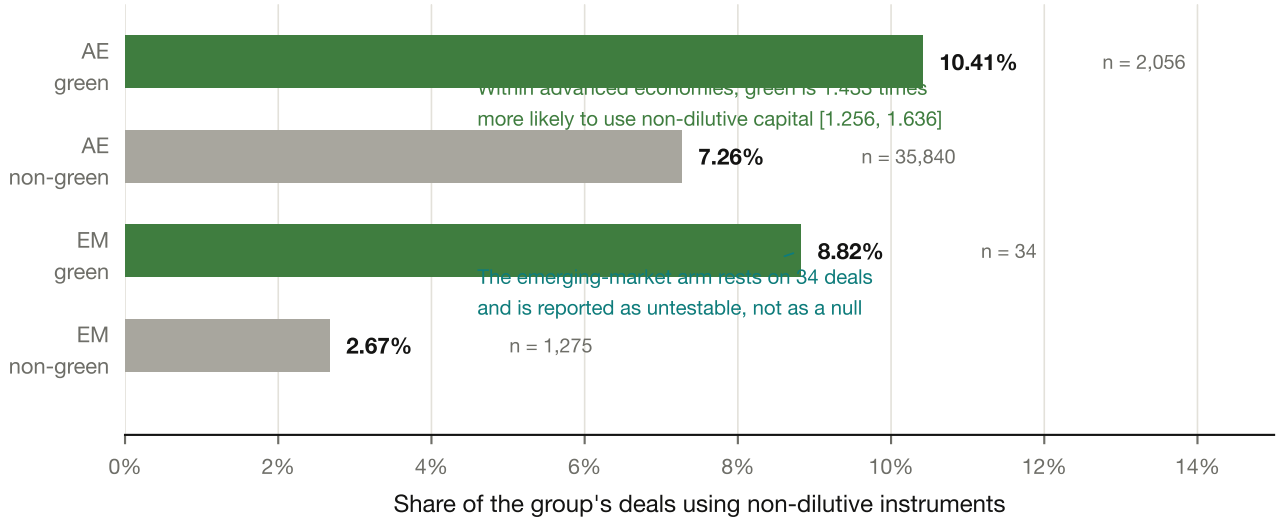
Green ventures lean harder on grants and debt than non-green ones do

Non-dilutive share of deals by bloc and green status, 2000–2012.



Source: Crunchbase 2013 Snapshot (CC BY 4.0); author's calculations. Non-dilutive instruments are grants, debt financing and post-IPO debt. Advanced-economy comparison: risk ratio 1.433 [1.256, 1.636], p = 1.2×10^{-7}. Project finance that is debt or concessional in substance but coded as an equity round understates the non-dilutive share on both sides, and more so for emerging markets where utility-scale generation accounts for 7 of 27 green companies; that bias direction was stated before these numbers were computed. Raw classifier output.
